

Felipe Campello D'Albuquerque Lima

Mid-level AI Agent Engineer · Production LLM systems & autonomous workflows · Python backend foundation
felipenehz2003@gmail.com · +55 (61) 99286-4664 · Brasília, Brazil linkedin.com/in/felipecampellolima · github.com/Satsuj1n

Open to USD remote contracts.

Summary

I build production AI agents and LLM systems. Backend foundation — 4 years in software engineering, including 2+ years shipping production distributed services, async pipelines and observability — now applying that to autonomous workflows running in production, not demos. Currently shipping a live crypto trading agent on AWS, plus tooling around Claude Code, MCP servers, and agent orchestration.

My take: agents are software. They need architecture, tests, observability and ops — not just a clever prompt. That's the gap I close.

Featured Projects

Cosmic Trader — Production crypto trading agent

Live on AWS EC2, deployed via Terraform. Multi-strategy execution with signal → risk → order architecture, Binance Futures integration, runtime risk management. Python.

Claude Code Toolkit — Agentic dev tooling · open-source at github.com/Satsuj1n/claude-code-setup

Custom slash commands, MCP server configurations, plugin patterns and hierarchical context scaffolds for agentic development workflows on large monorepos.

Agent Memory Patterns — LLM context infrastructure

Hierarchical CLAUDE.md scaffolds, per-folder context, observability patterns and evals harnesses for LLM-powered systems in production.

Experience

Backend Java Developer — *SEA Tecnologia* · April 2026 – Present

- Backend development on Liferay 7.4 CE — Service Builder for the data layer, REST Builder for API contracts, OSGi modules.
- Doc-first workflow: ADRs, design docs and contracts authored before implementation.
- GitLab MR review process with Conventional Commits.

Full Stack Developer (Backend & Automation) — *iZJob* (part-time) · March 2026 – Present

- End-to-end ownership of Full Stack automation and RPA solutions: design, implementation, testing, monitoring.
- Built robust automated flows with SeleniumBase handling edge cases (popups, timeouts, retries) at 95%+ execution success rate.
- Integrated legacy systems with modern web services through well-structured Python/Django APIs, with structured logging and failure alerting.
- Optimized automations with distributed cache, throttling and parallelization — 40% reduction in operational time, freeing 10+ hours/week of manual processing.
- End-to-end monitoring with dashboards and observability for full execution traceability and fast bottleneck detection.

Tech Lead — *ArtRadar* · December 2025 – Present

- Architected and built ArtRadar, a SaaS for art market intelligence (auction houses, galleries, fairs analytics) — Django 5.2, DRF, Celery, PostgreSQL, Redis.
- Clean Architecture (View → Use Case → Repository) with TDD discipline (pytest, Factory Boy); coverage gate enforced in CI.
- Dual payment provider integration — Stripe primary, Pagar.me fallback — for compliance and availability.
- CI/CD on GitHub Actions (lint, test, Docker build to GHCR), gunicorn in production. Leading a 2-person dev team.

Full Stack Developer (Backend & DevOps) — *Coco Bambu Restaurante* · August 2024 – March 2026

- Built multiple independent microservices (Python/FastAPI, Node.js) for critical domains (orders, payments, integrations) with end-to-end ownership: planning, implementation, deploy, observability.
- Implemented scalable APIs with retry logic, circuit breaker, rate limiting and event streaming (Pub/Sub) —

10,000+ requests/day at 99.98% success rate.

- Modeled data with TypeORM/SQLAlchemy, optimized queries (indexes, 60% query-time reduction), distributed cache with Redis/ElastiCache across multiple data stores (PostgreSQL, MongoDB, Firestore).
- Deployed 20+ containerized services on Kubernetes (GCP) with metric-based auto-scaling, IaC (Terraform, Helm) and CI/CD (GitHub Actions, Cloud Build).
- Instrumented with New Relic / GCP Monitoring, SLO-based alerting, automated tests (Jest), rigorous code reviews. Authored architectural decision records that raised the team's engineering bar.

Programming Tutor (Python & Software Engineering) — *University of Brasília (UnB) · August 2022 – Present*

- Mentored 50+ students in Python, algorithms, data structures and software engineering practices.
 - Focus on real-world problem solving, collaborative code review and design patterns.
 - Authored teaching material covering APIs, distributed systems, optimization and SOLID — preparing students for technical challenges in professional environments.
-

Stack

-
- **AI / Agents** — Anthropic, OpenAI, MCP, Claude Code, LangChain, RAG, prompt engineering, agent evals
 - **Backend** — Python · Django · FastAPI · Node.js · TypeScript · Java · Spring Boot · Liferay · REST · GraphQL · async workers
 - **Cloud & DevOps** — AWS · GCP · Terraform · Docker · Kubernetes · Helm · GitHub Actions · Cloud Build · Linux
 - **Data** — PostgreSQL · MongoDB · Redis · pgvector · Firestore · Cloud SQL
 - **Automation** — Playwright · SeleniumBase · headless browsers
 - **Messaging & Observability** — Pub/Sub · RabbitMQ · Kafka · New Relic · Grafana · Prometheus · structured logging · SLOs
-

Education

Licenciatura em Computação (Computer Science) — *University of Brasília (UnB) · In progress*

What I'm looking for

Remote contracts (USD) where AI agents do real work — production systems, not demos — and engineering quality is non-negotiable. Comfortable as the AI engineer in a small team or solo on a focused build. Available part-time or full contract.
